

WINQSB

M. en C. Eduardo Bustos Farías

DESCARGA DEL PROGRAMA

We will use WinQSB package as a computer-assisted learning tool to gain a good "hands-on" experience on concepts and techniques used in this course.

These labs experimentation will enhance your understanding of the technical concepts covered in this course.

The QSB is developed and maintains by Yih-Long Chang.

This software package contains the most widely used problem-solving algorithms in Operations Research and Management Science (OR/MS).

WinQSB Installation Instructions

1. Desempacar el archivo winqsb.zip
2. Buscar el folder C:/winqsbinstall
3. Abrir la carpeta Full y ejecutar setup.exe
4. Seguir las instrucciones de instalación

Computer Implementations with the WinQSB Package

- Use the LP/ILP module in your WinQSB package for two purposes: to solve large problems, and to perform numerical experimentation for understanding concepts we have covered in the LP and ILP sections.
- **Variable Type:** Select the variable type from the "Problem Specification" screen (the first screen you see when introducing a new problem); for linear programming use the default "Continuous" option.

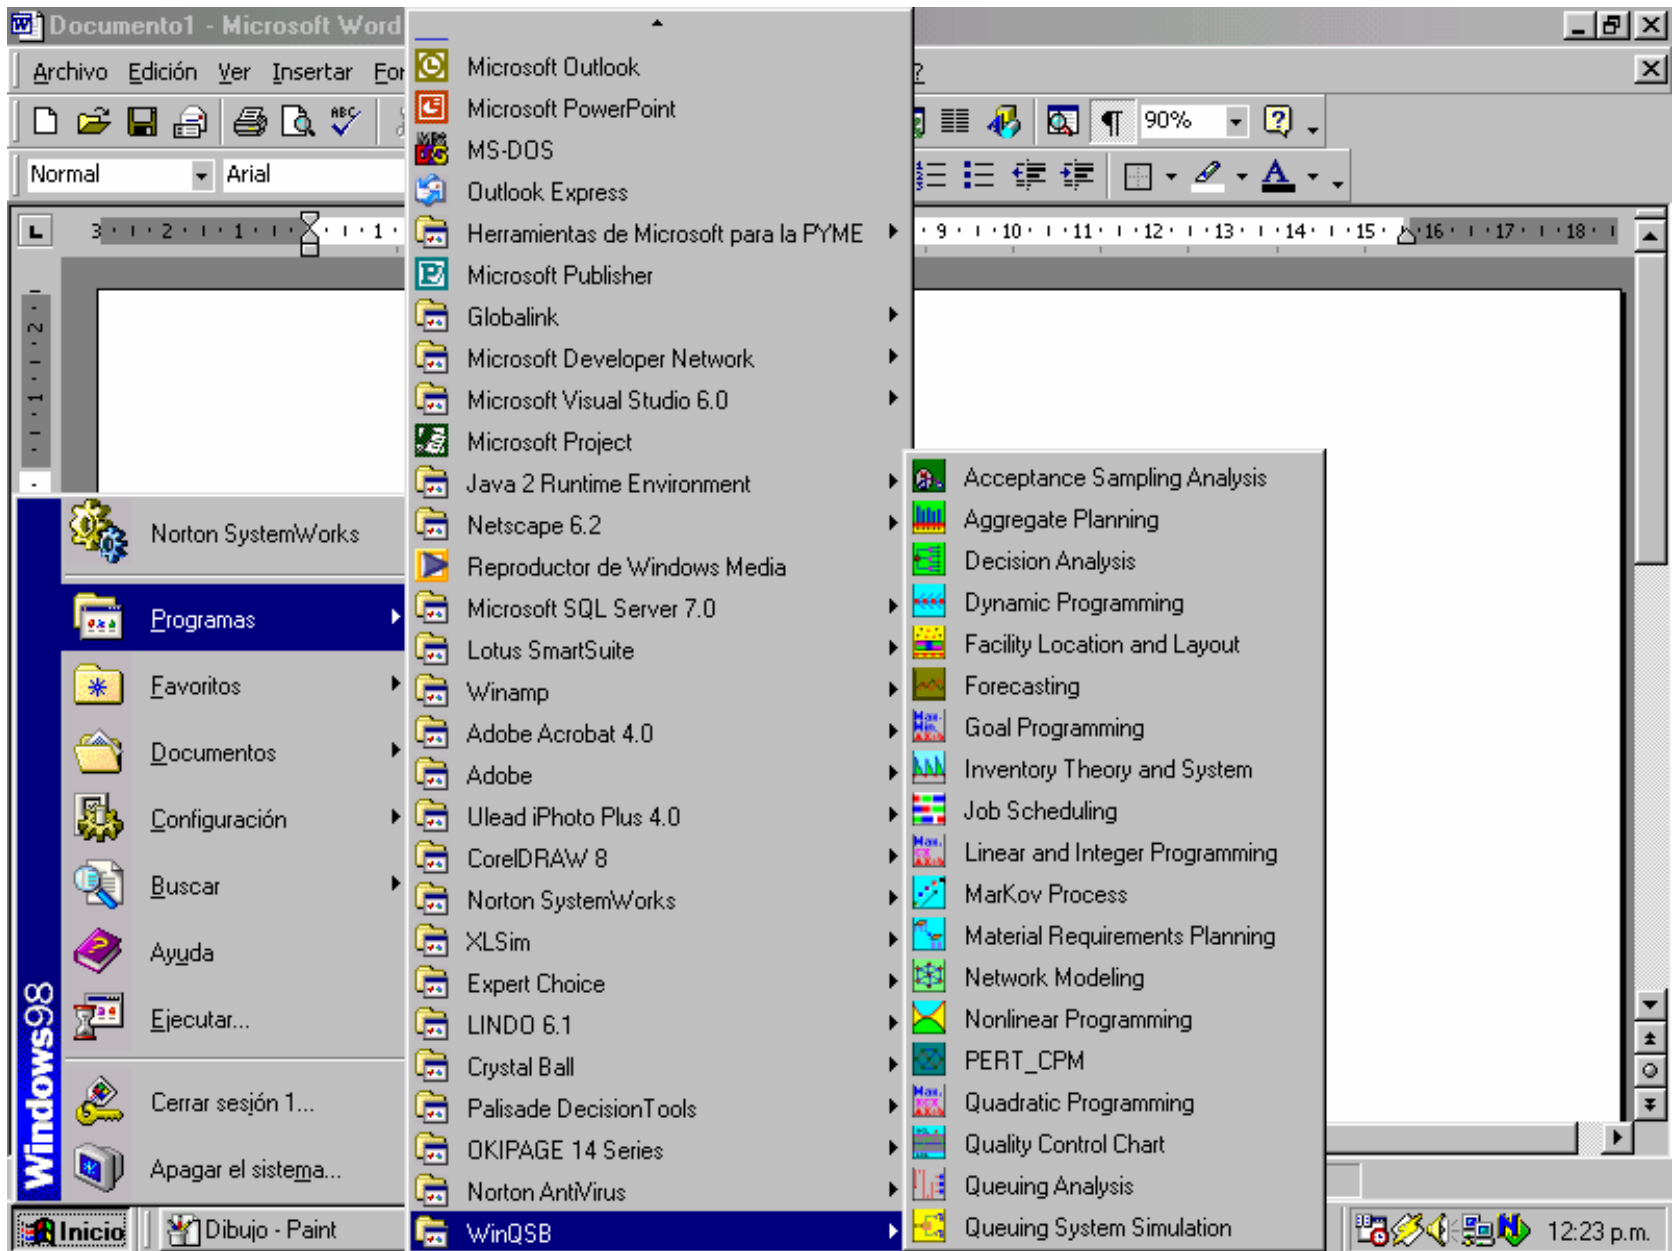

- **Input Data Format:** Select the input data format from the "Problem Specification" screen. Usually, it is preferred to use the Matrix format to input the data. In the Normal format the model appears typed in. This format may be found more convenient when solving a large problem with many variables. You can go back and forth between the formats, selecting the "Switch to the..." from the Format menu.

- **Variable/Constraint Identification:** It is a good idea to rename variables and constraints to help identify the context they represent. Changing the names of variables and constraints is done in the Edit menu.
- **Best Fit:** Using the best fit from the Format menu lets each column have its own width.

- **Solving for the Optimal Solution (if it exists):** Select Solve the problem from the Solve and analyze menu, or use the "solve" icon at the top of the screen. The run returns a "Combined Report" that gives the solution and additional output results (reduced costs, ranges of optimality, slack/surplus, ranges of feasibility, and shadow prices).
- **Solving by the Graphic Method:** Select the Graphic method from the Solve and Analyze menu (can only be used for a two-variable problem.) You can also click the graph icon at the top the screen. You can re-scale the X-Y ranges after the problem has been solved and the graph is shown. Choose the Option menu and select the new ranges from the drop down list.

Alternate Optimal Solutions (if they exist): After solving the problem, if you are notified that "Alternate solution exists!!", you can see all the extreme point optimal solutions by choosing the Results menu and then select Obtain alternate optimal.

LP-ILP Problem Specification

Problem Title:

Number of Variables:

Number of Constraints:

Objective Criterion

- Maximization
- Minimization

Default Variable Type

- Nonnegative continuous
- Nonnegative integer
- Binary (0,1)
- Unsigned/unrestricted

Data Entry Format

- Spreadsheet Matrix Form
- Normal Model Form
