

DATA SHEET

## 3Com Wireless Building-to-Building Bridge Site Survey and Installation

Reliable Installation of 3Com's Wireless Building-to-Building Bridge

### Key Benefits

### Ordering Information

The 3Com Wireless Building-to-Building Bridge Site Survey and Installation service facilitates a successful result while minimizing the risk of disruption to your business. 3Com familiarity with the unique needs of wireless bridge

installation translates into faster deployment. You gain long-term benefits knowing that your installation follows industry standards and that your bridge is installed to maximize the performance of the network.

#### Expert Assistance

Engineers experienced with 3Com wireless equipment manage the installation from start to finish. This service includes preplanning, a pre-install site review, as well as the hardware installation and configuration.

#### Hardware Installation

Each antenna is installed at the predetermined location. Each bridge is installed and connected to the appropriate antenna.

#### Pre-Install Site Review

A 3Com engineer arranges a site visit prior to the installation. At the site review, the engineer identifies the appropriate antenna, determines the need for a tower or firewall drilling, identifies antenna locations, and determines the location of the cabling drop for each bridge. At the conclusion of the visit, an installation plan is developed and the installation is scheduled.

#### Configuration and Testing

The bridges are powered up and configured. The engineer tests connectivity between the bridges. The bridges are then connected to the network and the engineer tests connectivity between buildings through the network.

#### Documentation and Training

Network configuration details are documented in writing. Equipment is labeled according to your instructions. An hour of hands-on training is provided to familiarize your staff with the new equipment.
