

ETOWAH VALLEY EQUIPMENT

CUBE DELAY TIMER

MODEL CT-10

The Cube Delay Timer from Etowah Valley Equipment is designed as an economical solution to the problems associated with the common contactor switch controls used in many self serve facilities.

The CT-10 is designed to eliminate the following problems:

- Contact "chattering"
- Pump "Hard Starts"
- Premature Contact Failure
- Short Check Valve Life
- Assorted Timer Gremlins caused by rapid contactor cycling

OPERATION

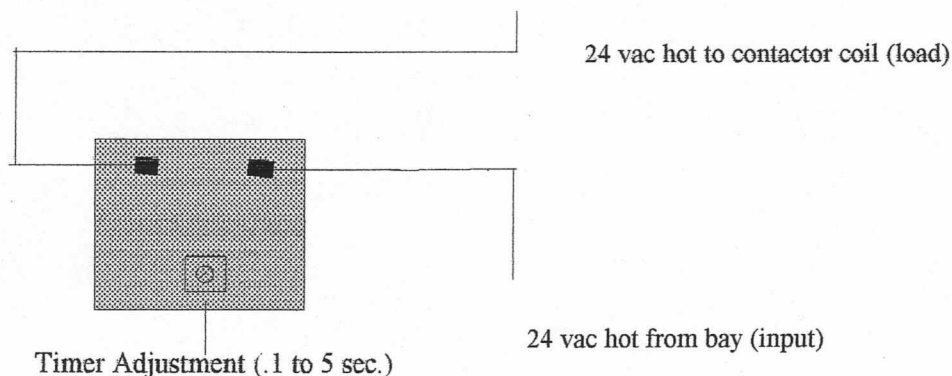

The CT-10 provides for a time delay ranging from .1 to 5 Seconds (User Selectable). When a customer selects a function on the bay rotary switch the Timer "delays" the signal to the high pressure pump contactor. This delay allows the customer to rotate the selector switch without the pump turning on and off several times as the switch moves between various high pressure functions.

INSTALLATION

To install the CT-10 simply wire the device in series with the contactor control 24VAC hot lead. Refer to hookup diagram for more information.

SPECIFICATIONS

Supply 24VAC Load 1 Amp Inrush 10 Amps
