TTED 5037 - Production Wood Bending Techniques

With a growing need for good design, many furniture makers turn to gentle curves and irregular shapes to accentuate their work. This course is intended to give furniture makers and technology educators the freedom to add Vacuum Forming, Hot Pipe Bending, Steam Bending and Laminate Bending to their furniture projects. Upon completion of this course, you will understand not only these bending and forming methods, but also the skills involved in creating working forms and the veneering techniques required to give your piece a professional look.
